## PROJECT II - MATH 800 DUE MARCH 15TH, 2018

- (1) Problem 19/p. 96
- (2) Let D be a connected domain, not necessarily simply connected. Assume that there is a sequence of holomorphic on D functions  $\{f_j\}$ , so that  $f_j \rightrightarrows f$ , i.e. it converges uniformly on the compact subsets of D to a holomorphic function<sup>1</sup> f. More precisely, this means

$$\forall K \Subset D, \forall \epsilon > 0, \exists N = N(\epsilon, K) : j > N, \sup_{z \in K} |f_j(z) - f(z)| < \epsilon.$$

Prove that

$$f'_j \rightrightarrows f'$$

**Hint:** Let  $K \Subset D$ . Choose a closed curve  $\gamma$  inside D, with positive orientation, so that K is in the interior of  $\gamma$ . Then, by the Cauchy integral formula,

$$f_j(z) = \frac{1}{2\pi i} \int_{\gamma} \frac{f_j(\xi)}{\xi - z} d\xi$$

and hence

$$f'_j(z) = \frac{1}{2\pi i} \int_{\gamma} \frac{f_j(\xi)}{(\xi - z)^2} d\xi.$$

Use now the convergence of  $f_j$  on the compact  $\gamma$  to conclude.

(3) Let f be a holomorphic function on a domain D. Let  $z_0 \in D : f(z_0) = 0$ . Prove that

$$g(z) := \begin{cases} \frac{f(z)}{(z-z_0)} & z \neq z_0\\ f'(z_0) & z = z_0 \end{cases}$$

is holomorphic in D.

Note that as a consequence, one can always write  $f(z) = (z - z_0)g(z)$  with  $g \in H(D)$ , whenever  $f(z_0) = 0$ .

Hint: Use Morera's theorem. Write

$$\int_{\gamma} g(z)dz = \int_{\gamma} g(z)dz + \int_{\Gamma_{\epsilon}} g(z)dz - \int_{\Gamma_{\epsilon}} g(z)dz$$

where  $\Gamma_{\epsilon} = \{z : |z - z_0| = \epsilon\}$  traced clockwise. By Cauchy theorem, show that

$$\int_{\gamma} g(z)dz + \int_{\Gamma_{\epsilon}} g(z)dz = \int_{\gamma \cup \Gamma_{\epsilon}} g(z)dz = 0$$

and then show that  $\lim_{\epsilon \to 0} \int_{\Gamma_{\epsilon}} g(z) dz = 0.$ 

(4) Problem 24/page 97.

<sup>&</sup>lt;sup>1</sup>This is actually always the case, don't need to assume it. That is, if  $f_j$  are holomorphic, then its limit f is holomorphic as well

(5) Problem 27/page 97.

**Hint:** For the case when g has zeros - show first that the function  $\frac{f(z)}{g(z)}$  is still well-defined and analytic at the zeros of g. For example, you can argue that it has removable singularities there.

- (6) Problem 30/page 98.Hint: Use the Cauchy estimates for balls with radius 1.
- (7) 37/page 99. **Hint:** Here, you may want to use an extension of Exercise 2 (which needs to be proved), namely that for each integer  $k, f_j^{(k)} \Rightarrow f^{(k)}$ .
- (8) 42/page 100.
